

A brief synopsis: Colocation Services

I worked for HostGator.com for over two years, so I had a fairly good understanding of how web hosting worked with regards to DNS, web servers, Load Balancing, and the common types of web hosting services provided by companies such as HostGator.com. However, Colocation was not a service provided by HostGator, which in short, means provide rack space within a data center and an Internet connection to a customer that wants to fully manage their server. It would be wise for the customer to have their own team of specialist to build and maintain the server, configure and monitor, and fully support on a day-to-day basis. Organizations or entities that use this service simply need a place to put the hardware because they don't have the space, security, or overall resources to have in house. HostGator.com essentially purchases colocation services from datacenters like CyrusOne here in Houston, TX, and another in Provo, Utah.
